

TRANSFORMATIVE MINDSET FOR MENTAL HEALTH TREATMENT

OUTCOME MONITORING & MEASURING

DATA-DRIVEN DISCUSSIONS THROUGH ACCOUNTABILITY AND PATIENT ENGAGEMENT

- ❖ Evidence-based outcomes
- ❖ Patient Engagement
- ❖ Data-driven discussions

A transformative mindset to Mental Health treatment with value opportunities for Payers & Providers

Treatment Benefits

- Reduce time to diagnose and provide better patient outcomes
- More productive data-driven sessions with Patients
- Visibility into patient symptoms between appointments
- Real-time Observer feedback provides a holistic patient view
- Increase patient engagement and accountability
- Improved insight into medication effectiveness

Data-driven Conversations

When properly reported, symptom changes and Patient health is quantifiable and measurable. However, participation from both Clinician and Patient is important for the success of measurement-based treatment. This participation starts with the Clinician and must be continually emphasized with the patient. Inconsistent use of available data on the part of the Clinician will surely deter the patient from meaningful contribution.

To convey the importance and usefulness of this measured approach, Clinicians ought to review measurement data with patients during each visit. This review reinforces to the patient the importance of their contribution, and empowers them to take an active role in the treatment process. Discussion topics using reported health data can be easily initiated based on symptom changes, spikes in patient charts and the triggering occurrence for those events. Patient and Observer journals are also excellent sources of insight into the thoughts of the patient and those around them. When both Clinician and Patient embrace this measured approach, the treatment process can become more focused and data-driven with the availability of meaningful data.
